"Food for Thought: Innovations and Opportunities for Animal Breeding"

7 pm in the Activity Room at Davis Senior Center 646 A Street, Davis

Don't miss this interesting and thought-provoking talk on how advances in biotechnology and genomics offer approaches to improve the sustainability of food animal production.

Discussion around agricultural biotechnology in food crops often gets steeped with issues related to pesticide use and multinational seed companies. The discussion around the use of animal biotechnology brings up a different set of opportunities and challenges. This presentation focuses on the contribution of breeding to animal agriculture and touches on the potential uses of new biotechnologies in animal breeding.

Dr. Alison Van Eenennaam is a genomics and biotechnology researcher and Cooperative Extension Specialist in the Department of Animal Science at the University of California, Davis.
